Client: Dr. Joyce Soares
Manuscript: LEAF ANATOMY OF NATIVE AND HYBRID ORCHID MICROPROPAGATED UNDER DIFFERENT SILICON CONCENTRATIONS

Formatting Summary and Additional Instructions
Prepared: September 1, 2011

Congratulations—you’re one step closer to submission!
This report summarizes the work that has been done to bring your manuscript into compliance with your targeted journal’s formatting requirements, and it describes any further changes that you will need to make before submitting your manuscript to your specified journal. Please review this document and the marginal comments in your manuscript carefully. If you have any questions, please contact us at support@journalexperts.com.

Formatting Editor’s General Comments

Your manuscript has been formatted for submission to Trees: Structure and Function. Please consult the comments below as you review your revised documents.

Title page

On your title page, in addition to the email address, please also include the telephone and fax numbers of the corresponding author.

Abstract

Your journal imposes a word-count limit of 250 on the abstract. Your abstract currently contains over 270 words. Please consider reducing the word count prior to journal submission.

Acknowledgments

Please note that acknowledgments of people, grants, funds, etc. (if any) should be placed in a separate section before the reference list. The names of funding organizations should be written in full.

Citations and Reference List

Your in-text citations and reference list were reformatted according to your journal’s style. Please note that Sandoval et al. 1994 was not originally included in your list. Please supply the missing information at the placeholder in the reference list.

Please also note that your journal may require you to translate your references into English. Please consult your journal editor.
Headings

The font style of your headings have been standardized for consistency.

Terminology

Some abbreviations were modified for consistency and logic; the term SiCaO3 was changed to the conventional form, CaSiO3.
